Wingtra is based in the heart of Zurich, Switzerland. In the 1 000 m² (10 800 ft²) office, the company houses 50+ employees out of which more than 20 focus on R&D. Wingtra’s engineers are graduates from the world’s 7th best university, ETH Zurich (Top-universities, 2018). The same engineers design and assemble drones inhouse and form Wingtra’s support team, reachable all year round in English, German and Mandarin.

Wingtra’s drone WingtraOne is rooted in years of robotics research at the Autonomous Systems Lab – one of the world’s best drone laboratories. Several of Wingtra’s employees have grounded their doctoral and master projects in exploring VTOL technology and still continue to do so.

About Wingtra

Wingtra is the world’s leading VTOL drone producer, headquartered in Switzerland. Since its market entry in early 2017, Wingtra has partnered with more than 30 of the biggest surveying equipment dealers across the globe such as RDO Equipment in US.

Switzerland, The Drone Hub

Since the 20th century, Switzerland has been known as one of the world’s most advanced economies. It also ranks as first in the World’s Global Innovation Index rating (2017).

Nowadays, Switzerland and especially Zurich, its largest city, houses the biggest players in the tech and drone industries. Not only Wingtra, but also Google, Facebook Oculus, Leica Geosystems, Pix4D, Auterion, PX4, Sensafy and Flyability – all are headquartered inside the Swiss borders. And that is the reason why Switzerland is often referred to as “The Hub of Drones” or “The Silicon Valley of Robotics”.

Wingtra is the world’s leading VTOL drone producer, headquartered in Switzerland. Since its market entry in early 2017, Wingtra has partnered with more than 30 of the biggest surveying equipment dealers across the globe such as RDO Equipment in US.
As a VTOL drone, WingtraOne can fly in two modes: hover and forward flight. While hovering, WingtraOne can be manually operated to fly in any direction like a helicopter: up and down, back and forward and to both sides.

A marine research group from Murdoch University, Australia is navigating WingtraOne from a boat. “Without WingtraOne’s ability to land in confined areas we wouldn’t have been able to execute our research”, commented Dr. Amanda Hodgson – the lead researcher.

WingtraOne is a vertical take-off and landing drone – a VTOL. We already see that VTOL drones are replacing fixed wings, especially in professional surveying and mapping applications. Why? There are many reasons. Let us discuss a few.
VTOL is not a choice, it's the only option

Vertical take-off
Contrary to fixed wings, the VTOL WingtraOne takes off automatically and at a safe distance from the drone operator. It means that there are no more “hand throwings”, no more being close to rotors risking a painful cut.

Besides, vertical take-off allows much better obstacle avoidance. During a hand or a catapult launch, there is always a risk of misjudging the distance to trees, buildings or mountains. With VTOL, such risks disappear. WingtraOne soars straight to the sky with no barriers in its way.

Forward flight and hover modes
WingtraOne switches to a forward flight mode by tilting 90° in the air. After entering the plane-like flying mode, WingtraOne flies at an airspeed of 16 m/s (35.8 mph) as efficiently as a fixed wing aircraft.

No piloting skills are needed to fly the WingtraOne drone - missions are fully autonomous and operated by an advanced autopilot. However, there is always a possibility to take over and fly the WingtraOne manually, both in hover and cruise modes.

In the hover mode, the drone operator can navigate WingtraOne in all possible dimensions. The functionality is especially useful to adjust landing in moving environments like boats or recently parked cars.

Vertical landing
A fixed wing drone basically performs controlled crash landings while “falling” on its belly. It causes great threat to the drone, its camera and the environment. Such landings also lead to frequent damages and lots of reliability issues are caused by continuous shocks. On the contrary, the VTOL WingtraOne lands smoothly without the threat of damaging high end sensors and the expensive drone itself.

Moreover, belly landings are impossible in many environments. Rough and gravel terrain, limited spaces or bushy fields pose a great risk: not just of damage but of complete breakage of the fixed wing drone or the camera it is carrying.

The VTOL WingtraOne can land safely on gravel, between the bushes, in forest aisles or wherever needed, without any risk to the expensive equipment.

VTOL advantages in short
+ Fully autonomous vertical take-off
+ Safe for the operator
+ Obstacle avoidance during take-off and landing
+ Take-off and landing in confined areas
+ Increased equipment lifetime and reliability
+ Hover mode for special situations
+ Safeguarding of the cameras
+ Smooth landing on a rough terrain
+ Ability to adapt to moving environment

WingtraOne vs. other fixed wing drones

Space needed for take-off and landing

WingtraOne can map this quarry in an hour’s flight. The resolution of the final map allows you to zoom in and see this very coin lying on the ground. And what is best – it is possible to know the exact coordinates of the coin down to an absolute accuracy of 1 cm (0.4 in).

With a GSD of 1 cm/px (0.4 in/px), you can clearly identify and locate tiny objects which are as small as a coin.

Map Info

- **GSD**: 1 cm/px (0.4 in/px)
- **Absolute accuracy**: 13 cm (0.5 in)
- **Coverage**: 130 ha (320 ac)

Imagine a coin lying on the grounds of a quarry the size of 240 American football fields.

WingtraOne can map this quarry in an hour’s flight. The resolution of the final map allows you to zoom in and see this very coin lying on the ground. And what is best – it is possible to know the exact coordinates of the coin down to an absolute accuracy of 1 cm (0.4 in).

With such unprecedented functionality, WingtraOne PPK can offer something that has never been seen before – broad coverage, brilliant resolution and ultra-high accuracy – all in one mapping device.
In February 2018, Wingtra announced the launch of WingtraOne PPK (Post-Processed Kinematics), which "took aerial mapping to the next level" (Reuters). WingtraOne PPK set a new benchmark in drone photogrammetry with down to 1 cm (0.4 in) absolute accuracy. As a VTOL, WingtraOne can carry heavy professional cameras. Combine VTOL, the top notch Sony RX1RII 42 MP camera and a PPK module from Septentrio and you get the accuracy that was previously only possible with terrestrial measurement devices. To this day, there is no other drone in the world that has reached this result but WingtraOne PPK.

1. There is a continuously measuring GNSS station that is part of the Swiss national CORS network (swipos), which provides optimal correction data for the PPK geotagging and allows absolute position determination at the centimeter level.
2. The ongoing research in the field provides a high precision fixed point network that guarantees 2 mm (0.08 in) horizontal absolute accuracy (Januth, Guillaume, 2018). These points can also be used as checkpoints.

In such circumstances, the Wingtra team conducted 24 flights with 2 different WingtraOne PPK drones over the facility. The flights were geotagged using the correction data provided by Swipos and geotagged images were post processed without GCPs within Pix4d.

The accuracy was assessed using the highly accurate checkpoints, that showed that the WingtraOne PPK drone is capable of reaching below 1 cm (0.4 in) absolute horizontal accuracy. Please find detailed information about the project in Wingtra’s White Paper on www.wingtra.com/accuracy-white-paper
Cover 400 ha (~1000 ac) in an hour's flight

With WingtraOne, it is finally possible to accept mapping projects you had to decline in the past. Vast forest areas, mountain ranges and even the biggest mines in the world can be mapped in a few flights in just a few hours of time.

In one flight* WingtraOne can map 400 ha (1000 ac), which is almost 3 times more than what a fixed wing drone can do and 40 times more (!) than any multi-copter. This makes WingtraOne literally the only drone which can perform exceptionally large projects, earlier only possible with manned aircrafts.

* With a GSD of 3 cm/px (1.2 in/px)

Coverage: WingtraOne vs. other drones

- **WingtraOne** 400 ha (1000 ac)
- **Other fixed wing drones** 140 ha (346 ac)
- **Multicopters** 15 ha (37 ac)

**MWH Geo-Surveys Ltd.** are using WingtraOne for a gold exploration project in the north of Finland. So far, they have surveyed an area bigger than 750 km² (190 000 ac) and have already gathered around 500 000 images.
WingtraOne has a high payload capacity and carries a wide range of high-end cameras. In addition, smooth vertical landings eliminate the risk of damaging the expensive cameras even in rough and complicated environments.

The flagship camera of WingtraOne is a Sony RX1RII. This 42 MP full frame camera takes high resolution pictures, which are incredibly detailed. Such pictures allow much more reliable reconstruction of orthomosaic maps and 3D models. It works especially well with grass fields, sand, forests or similar homogeneous patterns. When using a drone with a lower resolution sensor, it happens very often that map generation fails.

The high resolution that the Sony RX1RII camera ensures, means more pixels in the images. During the post processing, the coordinates are defined for each pixel in the map. Thus the more pixels there are, the more accurate the final map is. E.g. if you fly with a GSD of 3 cm/px (1.2 in/px), this is also the best possible accuracy. In contrast, the WingtraOne drone and the Sony RX1RII offer 1 cm/px (0.4 in/px) and lower GSDs that allows to reach absolute accuracy down to 1 cm (0.4 in).

### Modular WingtraOne payloads:

**RGB and specialty cameras**

The WingtraOne can be equipped with a range of cameras and lenses for diverse aerial surveying applications. The payloads are easy to swap so one drone can be used for different use cases.

### COMING SOON

**What is GSD?**

The Ground Sampling Distance (GSD) is the distance between two consecutive pixel centers measured on the ground. The bigger the value of the image GSD, the lower the spatial resolution of the image and the less visible details. The GSD is related to the flight height: the higher the altitude of the flight, the bigger the GSD value (Pix4D, 2018).
What are the use cases?

A wide range of WingtraOne applications.

Orthomosaic maps

2D orthomosaic maps contain the location (exact X, Y coordinates) and color information of each point in the map. These maps can be used for linear (distance) and surface calculations and alteration monitoring.

Wingtra’s customer Geoplan Team have used orthomosaic maps to maintain and organise the merger of vineyards in Western Switzerland.

"The vertical take-off and landing capability as well as the good airspeed were ideal for efficiently completing this task on the steep northern shore of Lake Biel."

Lukas Hurni from Geoplan Team, Switzerland

3D reconstruction

Collected 3D data can be turned into 3D models, point clouds, digital surface and terrain models, elevation maps, photorealistic reconstructions and more. These outcomes are used to calculate volume, distance, area surface and elevation, depict typography and create photorealistic models.

Strydom & Associates used WingtraOne to collect aerial imagery over the largest Uranium mine in Africa. They created 3D models, digital elevation and topographical maps in order to monitor the processes in the mine and perform volumetric calculations.

"The main advantage with the WingtraOne was the high quality images from the camera. Sony RX1R II camera with 35 mm lens makes it possible to cover the area efficiently at a high altitude."

Herman Strydom from Strydom & Associates, Namibia
Single Images

Single aerial images collected by the WingtraOne are used in various research areas. Combined with machine learning algorithms, these images can transport massive amounts of information.

A marine research group from Murdoch University is using WingtraOne to collect single images over a vast region in the ocean. This information is used to monitor Dugongs, vulnerable sea mammals, and ensure better protection of the threatened species.

"Without Wingtra’s ability to land in confined areas we wouldn’t have been able to execute our research. We operate the drone from a boat."

Amanda Hodgson from Murdoch University, Australia

"We chose WingtraOne because of its versatility: ability to take off and land accurately on a small piece of land without damaging the camera, switch payloads and map big fields in windy weather conditions."

Romain Cruse from CARIGE, Martinique

Multispectral imagery

With a RedEdge-M camera that WingtraOne carries, it is possible to collect multispectral data and turn it into chlorophyll maps, NDVI layers, digital surface models or RGB images. These outcomes can be used for monitoring plant health and vigor, evaluate surface properties, water flow and much more.

In Martinique, Wingtra’s customers CARIGE use multispectral imagery to produce chlorophyll maps of sugarcane farms. The data helps them to identify unhealthy plants and ensure better crop quality.
Partnering with Wingtra really solidifies our vision of offering a strong and unique portfolio of commercial UAVs to our diverse customer base. Their VTOL drone WingtraOne is a huge technological advancement, which finally fills the gap between multirotor and fixed wing drones.

For CR Kennedy, the Wingtra organization and the WingtraOne product range are perfect partners. In choosing our products and partners, certain things are very important to us. This includes a unique and high end product that genuinely brings something new and exciting to our customers, a product range that offers accuracy and precision to the highest degree and that through the use scenario the product and provider allow us and our customers to operate with the highest degree of reliability and professionalism.

“We are glad that we can finally offer solution that’s able to map large areas with high accuracy Integration of VTOL concept in fixed wing UAVs is something revolutionary in the field of aerial data acquisition. Partnership with Wingtra is important for us because it will bring to our customers a reliable system which will help them to make better decisions in fields of mapping, agriculture, forestry and mining.”

WingtraOne and especially the newly launched high-precision PPK drone is a great fit to our high-demand portfolio covering mining, agriculture, construction and surveying equipment. The combination of VTOL and PPK technologies make WingtraOne finally fill the gap between multirotor and fixed wing drones.

Where to buy?

WingtraOne is available through a global distribution network.

At Wingtra, we work with the best partners around the world to offer advanced products and wide-ranging services to WingtraOne owners. We are constantly looking for partners that help us thrive in product and service quality. To locate the Wingtra distributor closest to you, visit www.wingtra.com/where-to-buy
